Active Learning in Individual Setting

Summary

Active Learning Criteria

- Maximum Uncertainty (MU)
 - $\hat{x}_n = \arg \max_{x_n} H\left(y_n | x^n, y^{n-1}\right).$
 - Sensitive to noise.
- Bayesian Active Learning by Disagreement (BALD) [Houlsby, et al 2011]

•
$$\hat{x}_n = \arg \max_{x_n} I(\theta; y_n | x^n, y^{n-1}).$$

- Heuristic criteria.
- Universal Active Learning (UAL) [Shayovitz & Feder 2021]
 - $\hat{x}_n = \arg \min_{x_n} I(\theta; y | x, x^n, y^n).$
 - Derived using the Capacity Redundancy Theorem.
 - Takes into account the un-labelled test set.

Learning in Individual Setting

Assumptions

- No underlying parametric distribution.
- Training pool: $z^N = (x^N, y^N)$
- Test pair: (*x*, *y*)
 - x can be accessed.
 - y is not available.
- Probabilistic learners: q(y|x).
- Log-loss cost function: $-\log(q(\cdot|x, z^N))$.

Learning in Individual Setting

Summary

Learning in Individual Setting

Assumptions

- No underlying parametric distribution.
- Training pool: $z^N = (x^N, y^N)$
- Test pair: (x, y)
 - x can be accessed.
 - y is not available.
- Probabilistic learners: q(y|x).
- Log-loss cost function: $-\log(q(\cdot|x, z^N))$.

Fundamental Problem

Minimizing the log-loss in the individual setting is ill-posed.

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Learning in Individual Setting

Define a hypothesis class:

$$P_{\Theta} = \{ p(y|x,\theta) | \theta \in \Theta \}$$

Define the learning problem:

$$R(x; z^{n}) = \min_{q} \max_{y \in \mathbb{Y}} \log \left(\frac{p(y|x, \hat{\theta})}{q(y|x, z^{n})} \right)$$

where:

$$\hat{\theta} = \arg \max_{\theta \in \Theta} \left[\log p\left(y, y^{n} | x, x^{n}, \theta \right) + \log \left(w\left(\theta \right) \right) \right]$$

and

$$p(y|x,\hat{\theta}) \in P_{\Theta}$$

イロト イポト イヨト イヨト

Predictive Normalized Maximum Likelihood (pNML) / Stochastic Complexity

Theorem (Fogel and Feder 2018)

The universal learner, q_{pNML} , minimizes $R(x; z^n)$:

$$q_{pNML}(y|x, z^{N}) = \frac{p(y|x, \hat{\theta})}{\sum_{y} p(y|x, \hat{\theta})}$$
$$R(x; z^{n}) = \log \sum_{y \in \mathbb{Y}} p(y|x, \hat{\theta})$$

The pNML regret is exactly the stochastic complexity of P_{Θ} .

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Active Learning in Individual Setting

What is a "good" training set, z^n ?

Small $R(x; z^n)$ on many test features x

- Optimizing over *zⁿ* is not possible!
- Find training features x^n which minimize the worst case labels y^n :
 - Average mini-max regret:

$$C_{n}^{A} = \min_{x^{n} \in \mathbb{X}^{n}} \max_{y^{n} \in \mathbb{Y}^{n}} \sum_{x} R(x; z^{n})$$

• Worst mini-max regret:

$$C_n^W = \min_{x^n \in \mathbb{X}^n} \max_{y^n \in \mathbb{Y}^n} \max_{x} R(x; z^n)$$

18/35

Summary

Active Learning in Individual Setting

- In the next slides we examine IAL for different hypothesis classes:
 - One dimensional Barrier
 - Linear Regression
 - Gaussian Process Classification
- It will be shown that IAL coincides with known class specific criteria and thus is a unified framework for active learning!

Summary

One Dimensional Barrier - Separable Data

The 1-dimensional barrier hypotheses class, P_{Θ} , is defined as:

$$\mathcal{D}(\mathbf{y} = 1 | \mathbf{x}, \theta) = \mathbb{1} \left(\theta < \mathbf{x} \right)$$

where the input $x \in [0, 1]$, output $y \in \{0, 1\}$ and the unknown barrier $\theta \in [0, 1]$.

Summary 00

One Dimensional Barrier - Separable Data

The 1-dimensional barrier hypotheses class, P_{Θ} , is defined as:

$$\mathcal{D}(\mathbf{y} = 1 | \mathbf{x}, \theta) = \mathbb{1} \left(\theta < \mathbf{x} \right)$$

where the input $x \in [0, 1]$, output $y \in \{0, 1\}$ and the unknown barrier $\theta \in [0, 1]$.

Theorem (Shayovitz & Feder 2022)

For one dimensional separable data, greedy IAL induces a selection policy which coincides with binary search and thus optimal.

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Proof Outline

• IAL can be written as:

$$C_{n|n-1}^{A} = \min_{x_{n} \in \mathbb{X}} \max_{y_{n} \in \mathbb{Y}} \sum_{v \in \mathbb{V}} \int_{u \in \mathbb{U}} p\left(v|u, \hat{\theta}^{n}\right) du$$

where $\hat{\theta}^n$ is the maximum likelihood estimation based on training and test data:

$$\hat{\theta}^{n} = \arg \max_{\theta \in \Theta} p\left(y^{n}, v | x^{n}, u, \theta\right)$$

Likelihood for zⁿ⁻¹:

$$\rho\left(y^{n-1}|x^{n-1},\theta\right) \propto \mathbb{1}\left(\theta \geq \theta_{min}^{n-1}\right) \mathbb{1}\left(\theta < \theta_{max}^{n-1}\right)$$

where θ_{min}^{n-1} and θ_{max}^{n-1} represent the support of the posterior on θ given x^{n-1} , y^{n-1} .

Introduction	Learning in Individual Setting	Active Learning in Individual Setting	Summary

- Select feature point, x_n , which can be any point in the support of $p(y^{n-1}|x^{n-1},\theta)$.
 - For $y_n = 0$:

Proof Outline

$$p(y^n|x^n,\theta) \propto \mathbb{1} (\theta \ge x_n) \mathbb{1} \left(\theta < \theta_{max}^{n-1}\right)$$

• For $y_n = 1$:

$$p(y^n | x^n, \theta) \propto \mathbb{1}\left(\theta \ge \theta_{\min}^{n-1}\right) \mathbb{1}\left(\theta < x_n\right)$$

<ロ>< 団> < 団> < 豆> < 豆> < 豆> < 豆 > < 豆 > < 豆 > < 豆 > < 豆 22/35

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Proof Outline

• IAL can be simplified to:

$$\max_{y_n \in \mathbb{Y}} \int_{u \in \mathbb{U}} \left(\mathbb{1} \left(\hat{\theta}_{v=1}^n < u \right) + 1 - \mathbb{1} \left(\hat{\theta}_{v=0}^n < u \right) \right) du = \max\{l_0, l_1\}$$

where

$$I_0 = |1 - \theta_{max}^{n-1}| + 2|x_n - \theta_{max}^{n-1}| + |x_n|$$

and

$$I_1 = |\theta_{\min}^{n-1}| + 2|\theta_{\min}^{n-1} - x_n| + |1 - x_n|$$

・ロ・・聞・・思・・思・ うくぐ

23/35

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Proof Outline

We note that:

$$I_0 = 1 + |x_n - \theta_{max}^{n-1}|$$

and

$$I_1 = 1 + |\theta_{min}^{n-1} - x_n|$$

Therefore,

$$C_{n|n-1}^{A} = \min_{x_{n} \in \mathbb{X}} \max\{|x_{n} - \theta_{max}^{n-1}|, |\theta_{min}^{n-1} - x_{n}|\}$$

The point x_n which minimizes the maximal length is the mid point of the interval $\left[\theta_{min}^{n-1}, \theta_{max}^{n-1}\right]$

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Linear Regression

The linear regression hypothesis class:

$$\underline{y} = X\underline{\theta} + \underline{z}$$

where:

- $X \in \mathbb{R}^{nxp}$ is a design matrix of *n* feature vectors.
- $y \in \mathbb{R}^n$ is the vector of observable responses.

•
$$\underline{z} \sim N(0, \sigma^2 \mathbb{I}_n).$$

The error covariance of the OLS solution is:

$$\Sigma^{-1} = \sigma^2 \left(X^T X \right)^{-1}$$

Summary

Experimental Design

- The design problem reduces to find a design matrix X which "minimizes" the covariance matrix $\Sigma^{-1} = (X^T X)^{-1}$.
- Extensive research over the last decade under the mathematical field of "Optimal Experimental Design": [Pukelsheim 2006]

• **A** Optimal Design:
$$f_A(\Sigma) = \frac{1}{\rho} Tr(\Sigma^{-1})$$

- **D** Optimal Design: $f_D(\Sigma) = det(|\Sigma|)^{-\frac{1}{p}}$
- **G** Optimal Design: $f_G(\Sigma) = \max_X \operatorname{diag} \left(X \Sigma^{-1} X^T \right)$
- **V** Optimal Design: $f_V(\Sigma) = Tr(X\Sigma^{-1}X^T)$

Learning in Individual Setting

Active Learning in Individual Setting

Summary

IAL for Linear Regression

Theorem (Shayovitz & Feder 2022)

For linear regression, IAL becomes:

$$C_n^A = \min_{X^n} \operatorname{Tr} \left(X \left(X_n^T X_n + \lambda I \right)^{-1} X^T \right)$$

$$C_n^W = \min_{X^n} \max_{X} \operatorname{diag} \left(X \left(X_n^T X_n + \lambda I \right)^{-1} X^T \right)$$

where X is a matrix which is a concatenation of the test vectors x and λ is a regularization factor.

Observations

- IAL coincides with G and V optimal designs:
- Note that IAL is a function of the training features xⁿ only and have no dependence on their respective labels yⁿ.
- Therefore, no need for online feedback and the training set selection can be cast as a subset selection problem performed offline.
- This problem is NP hard and approximate solutions are needed.

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Gaussian Process Classification

Gaussian Process Classification (GPC) is a powerful, non-parametric kernel-based model.

 $f \sim GP(\mu(\cdot), k(\cdot, \cdot))$

 $y|x, f \sim Bernoulli(\Phi(f_x))$

- *f* is a function of a feature point *x* and is assigned a Gaussian process prior with mean μ(·) and covariance function k(·, ·).
- The label *y* is Bernoulli distributed with probability $\Phi(f_x)$, where Φ is the Gaussian CDF.

Summary

Variational Inference

- Given a training set, the posterior over *f* becomes non-Gaussian and complicated.
- Approximate inference is used to model the posterior distribution.

The MAP estimators \hat{f}_{x_n} and \hat{f}_u are computed based on:

$$\hat{f}_{x_{n}}^{y_{n}}, \hat{f}_{u}^{v} = \arg \max_{f_{x_{n}}, f_{u}} p(v|f_{u}) p(y_{n}|f_{x_{n}}) q(f_{x_{n}}, f_{u}|y^{n-1}, x^{n-1})$$

where $q(f_{x_n}, f_u|y^{n-1}, x^{n-1})$ is a Gaussian distribution.

Introduction

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Data Set

- USPS hand-written digits data set.
- Total of 9298 handwritten single digits between 0 and 9.
- Each image consists of 16 × 16 pixels.
- Half of 9298 digits are designated as training and the other half are as test.
- Pixel values are normalized to be in the range of [-1, 1].

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Empirical Comparison

- Binary classification task: the digit 0 vs {2,4,7,8}.
- PCA is computed using the un-labeled training data.
- After centering and PCA, the 5 largest Eigenvalues of the PCA are used as the feature space for classification.
- A small random subset of the unlabeled test set is given to the learner (15 random samples) along with an initial labelled training set (3 random examples).
- IAL is compared to UAL, BALD, MU and passive learning.

Learning in Individual Setting

Active Learning in Individual Setting

Summary

Empirical Results

33/35

Summary

- Presented a novel AL criterion:
 - IAL takes into account the un-labelled test set.
 - IAL is not constrained by the assumption that the data is generated by some class of distributions.
- IAL can be viewed as a unified framework for active learning in a variety of hypothesis classes:
 - For binary classification, this criterion coincides with binary search
 - For linear regression, this criterion coincides with G and V optimal designs.
- In empirical comparison with state of the art AL criteria, IAL proved to be superior in terms of sample complexity.
